

**Managing wounds as a team in the eHealth context: The EWMA position document
'Managing Wounds as a Team'**

William McGuiness

Telecommunication technologies have rapidly broken down the social 'rules' about human interaction. Geographic boundaries, social status or income levels are no longer the determinants the manners in which people communicate. The development of social media and other network technologies now facilitate the rapid and ongoing communication with anyone. The health care setting is now different. But does the introduction of such technologies facilitate interdisciplinary interactions? This presentation will use the model described in the EWMA 'Managing Wounds as a Team' position document to explore the use of e-health technologies to foster interdisciplinary interactions.
