

Where will healthcare be in 10 years? Introduction to the concept of borderless healthcare

Yu Wei Siang

The presentation will describe how healthcare will evolve from a hospital-centric model to a home and consumer-centric model where mHealth and IOTs (internet of things) will play a vital role in harvesting big data to herald the new era of digital epidemiology and predictive healthcare. An example of how a high-tech caregiver and a woundcare app can inter-operate seamlessly to create a new model of post-op support via technology will be used. In addition, Dr Wei will also share the model of the world's first O2O (Online To Offline) Smart Life Innovation Centre recently established at the heart of Shanghai by the Borderless Healthcare Group. The centre will demonstrate how multi-disciplinary industries like farming, media, telecommunication, 3D printing and tissue banking etc will converge for better healthcare via a borderless smart home.
