

Background & introduction to the eHealth in Wound Care: From conception to implementation document

In light of the challenges facing health-care systems, coupled with the rapid development of new technologies presented as solutions, and the limited amount of high-quality evidence for the use of telemedicine and telehealth in chronic wound management EWMA has developed this document on eHealth in wound care. The document sections lean on the structure and focus areas of the Model for Assessment of Telemedicine (MAST) which defines crucial items to evaluate an eHealth application. The content of the document is developed on the basis of a literature review, identifying available documentation for use of eHealth solutions in wound care. This presentation will present the background and provide an introduction to the eHealth in Wound Care: From conception to implementation document.
